

Gold Crack EA V1 Input Settings Guide

Practical reference for clearer setup decisions and better risk awareness.

Purpose

This guide explains what each EA input controls, so clients can configure settings with clearer understanding before going live.

Important

Input values directly affect lot behavior, margin usage, drawdown pace, and overall risk profile. This document is an operating guide, not a profit guarantee.

Prepared for

Client use in live or demo account configuration.

Scope

Input definitions, code references, risk controls, and recommended client practice.

Quick note

Short labels such as D1, R1, T1, and F3 are panel references for faster identification. They are not source code instructions.

Important Risk Warning

Review this section before adjusting lot, grid, or risk parameters.

Topic	Important information
Grid / averaging risk	The EA can open additional positions when price moves against the basket. Exposure can increase quickly.
Large lot risk	Lot size can grow based on lot multiplier and number of entries. Small starting lots may still become large after many levels.
Margin risk	If account capital is too small for selected settings, margin call or stop out can happen during strong market movement.
Settings are not universal	A setup that works on one broker, spread, symbol, or balance may behave differently on another account.
Risk tools	Equity Risk Limit and Daily Profit Target are control tools, but they do not remove trading risk completely.

Example Lot Progression

The example below shows how lot size can grow when lot multiplier is active. Actual behavior depends on market movement and EA settings.

Level	Lot	Level	Lot
1	0.01	9	0.62
2	0.02	10	1.04
3	0.03	11	1.75
4	0.05	12	2.94
5	0.08	13	4.94
6	0.13	14	8.30
7	0.22	15	13.94
8	0.37	16	23.42

Main Input Settings

One-page view of all primary input controls.

Setting	Meaning
License Key	Used only in licensed builds. No-license builds ignore this field.
Straddle Distance	Distance from current price for Buy Stop and Sell Stop pending orders.
Starting Lot	First lot size used by EA. Higher value increases exposure faster.
Max Trades	Maximum number of grid entries allowed per direction or basket logic.
Pip Step 1	Grid spacing for early entries. Smaller step can trigger more often.
Pip Step 2	Grid spacing for later entries after early grid stages.
Take Profit	Basket take-profit distance used for closure in profit.
Lot Exponent	Multiplier for lot growth at next grid level.
Total Equity Risk	Emergency equity limit. Example: 1.0 = 100%, 0.2 = 20%.
Slippage	Maximum accepted execution price deviation.
Lot Digits	Lot rounding precision based on broker lot rules.
Max Trade Open Hours	Optional time limit for how long trades may remain open.
Buy Magic Number	Unique ID for buy-side orders managed by EA.
Sell Magic Number	Unique ID for sell-side orders managed by EA.
Use Pause Window	Enable or disable daily pause period.
Pause Start / End Hour-Minute	Pause window timing inputs (Malaysia time if configured).
Show Chart Info	Show or hide EA information on chart.
Use Daily Profit Target	Enable or disable fixed daily target control.
Daily Profit Target USD	Fixed target amount in account currency, not percentage.

Daily target behavior

Daily Profit Target uses a fixed amount, not a percentage. Daily reference follows EA reset logic, not manual counting from phone app.

Important: target value does not auto-increase from previous day result. It follows configured value unless settings are changed.

Short Code Reference

Quick lookup for compact labels shown in the EA input panel.

Code	Setting	What it means
D1	Straddle Distance	Pending order starting distance from current price.
V1	Starting Lot	First lot size used by EA.
N	Max Trades	Maximum number of grid entries allowed.
S1	Pip Step 1	Grid spacing for earlier entries.
S2	Pip Step 2	Grid spacing for later entries.
T1	Take Profit	Basket take-profit distance.
E1	Lot Exponent	Lot multiplier for next grid level.
R1	Total Equity Risk	Equity risk limit. 1.0 = 100%, 0.2 = 20%.
P1	Slippage	Allowed execution price deviation.
P2	Lot Digits	Lot rounding precision for broker rules.
H1	Max Trade Open Hours	Optional maximum open trade duration.
M1 / M2	Buy/Sell Magic Number	Identifiers for buy-side and sell-side orders.
F1	Use Pause Window	Enable or disable pause window.
T2-T5	Pause Time Inputs	Pause start/end hour and minute.
F2	Show Chart Info	Show or hide chart display information.
F3	Use Daily Profit Target	Enable or disable daily target.
DT1	Daily Profit Target USD	Daily target amount in account currency.

Risk Controls

Example value	Meaning
1.0	100% equity risk limit. This is very high and should be used carefully.
0.5	50% equity risk limit. EA risk control can trigger around half account equity loss, depending on broker conditions.
0.2	20% equity risk limit. More conservative than 0.5 or 1.0.
0.1	10% equity risk limit. Lower exposure but may close baskets earlier.

Recommended Client Practice

Simple operating habits for clearer execution and safer deployment.

Use enough capital

Make sure account balance and margin are suitable for lot size, grid distance, and max trades. Small capital with aggressive settings can fail quickly.

Recommended Account Configuration

Account Type	Cent Account
Initial Testing Deposit	\$100 USD (10,000 USC)
Recommended Operating Capital	\$500 USD (50,000 USC) or higher

Cent accounts allow you to trade XAUUSD without requiring large capital. However, 10,000 USC is only the minimum to get started and carries high risk, as margin can be quickly affected during market volatility. For better stability and risk control, 50,000 USC or more is strongly recommended, as it provides more room to withstand market fluctuations.

Practical checkpoints

- Change slowly: Change one setting at a time so the result is easier to understand.
- Review before live use: Use demo, tester, or small-risk conditions before larger capital.
- Watch spread: High spread can affect pending order placement, TP distance, and execution quality.
- Avoid over-aggressive lots: Starting lot and lot multiplier are the biggest drivers of risk.

Client Notes

- Clients may adjust settings according to comfort level, account size, and risk appetite.
- Always ensure capital is sufficient for selected EA settings, especially when using grid or lot multiplier logic.
- Lower risk settings may produce slower results, while aggressive settings may increase both profit potential and drawdown risk.
